Zomato Sales Dashboard Using PowerBI

Project Report

Prepared by: Syed Sohail **Tool used:** Microsoft Power BI Desktop **Dataset:** Zomato food delivery orders (6,000 records, Jan 2025 – Sep 2026)

1. Introduction

Food-delivery platforms such as Zomato generate a huge amount of order data every day. On its own, this data is just rows and columns. To make decisions, a business needs to see it as clear numbers and charts: how much money is being earned, which cities and cuisines perform best, when customers order, and which payment methods customers prefer.

This project builds an interactive sales dashboard in Power BI that turns raw Zomato order data into visual insights. A user can click any city, cuisine, customer type or date range, and the whole dashboard updates instantly.

2. Objectives

- To clean and prepare food-order data for analysis.
- To calculate key business measures: revenue, orders and average order value.
- To identify the best-performing cities, cuisines and restaurants.
- To find the peak ordering hours.
- To build an interactive dashboard where clicking any chart filters the others.

3. Dataset Description

The dataset contains 6,000 orders placed between 1 January 2025 and 30 September 2026 across 7 cities: Hyderabad, Bengaluru, Mumbai, Delhi, Chennai, Pune and Kolkata.

Note: the dataset is a realistic sample prepared for this project, not Zomato's confidential internal data. Restaurant names are illustrative.

Column	Meaning
Order_ID	Unique order number
Order_Date	Date the order was placed
Order_Hour	Hour of the day (0–23)
City	Delivery city
Restaurant_Name	Restaurant that fulfilled the order

Column	Meaning
Cuisine	Biryani, North Indian, South Indian, Chinese, Fast Food, Desserts, Healthy
Food_Type	Veg or Non-Veg
Customer_Type	New, Returning or Gold Member
Order_Value	Food value before discount (₹)
Discount_Amount	Discount given (₹)
Delivery_Fee	Delivery charge (₹)
Final_Amount	Order value – discount + delivery fee (₹)
Payment_Mode	UPI, Card, Cash on Delivery, Zomato Wallet
Delivery_Time_Min	Minutes taken to deliver
Customer_Rating	Rating from 1 to 5
Order_Status	Delivered, Cancelled or Refunded

4. Data Cleaning and Preparation

Before building the dashboard, the data was prepared as follows:

- Removed duplicate orders (each Order_ID is unique).
- Set correct data types: dates as Date, amounts as numbers, names as text.
- Left blanks only where they make sense: cancelled orders have no delivery time and no rating.
- Kept a consistent spelling for city, cuisine and status values.
- Created date fields (Year, Month Name, Month No, Day Name) so trends over time can be shown.

5. Tools and Method

1. Loaded the CSV file into Power BI Desktop using Get data → Text/CSV.
2. Checked and fixed column types in the data view.
3. Created DAX measures for the key business numbers.
4. Built visuals and arranged them in a dashboard layout.
5. Arranged all visuals on one page so that clicking any chart filters the rest.

DAX measures used

- **Total Revenue** – sum of Final_Amount for delivered orders only.
- **Total Orders** – count of all orders.
- **Avg Order Value** – revenue divided by number of delivered orders.

- **Avg Delivery Time** and **Avg Rating** – averages of delivery minutes and customer rating.
- **Total Discount** – sum of discounts given.

Revenue counts only Delivered orders, because cancelled and refunded orders do not bring in real money.

6. Dashboard Design

The dashboard is a single page with a title, three KPI cards and six charts. Clicking any bar or slice filters the other visuals:

- Title "Zomato Sales Dashboard" at the top.
- KPI cards: Total Revenue, Total Orders and Avg Order Value.
- Charts: total revenue by month for 2025 and 2026 (area chart), total orders by payment mode (donut), total revenue by restaurant (bar), total orders by cuisine (donut), total revenue by city (bar) and total orders by hour of the day (column).
- Slicers on the left for City, Cuisine, Customer Type and Order Date.

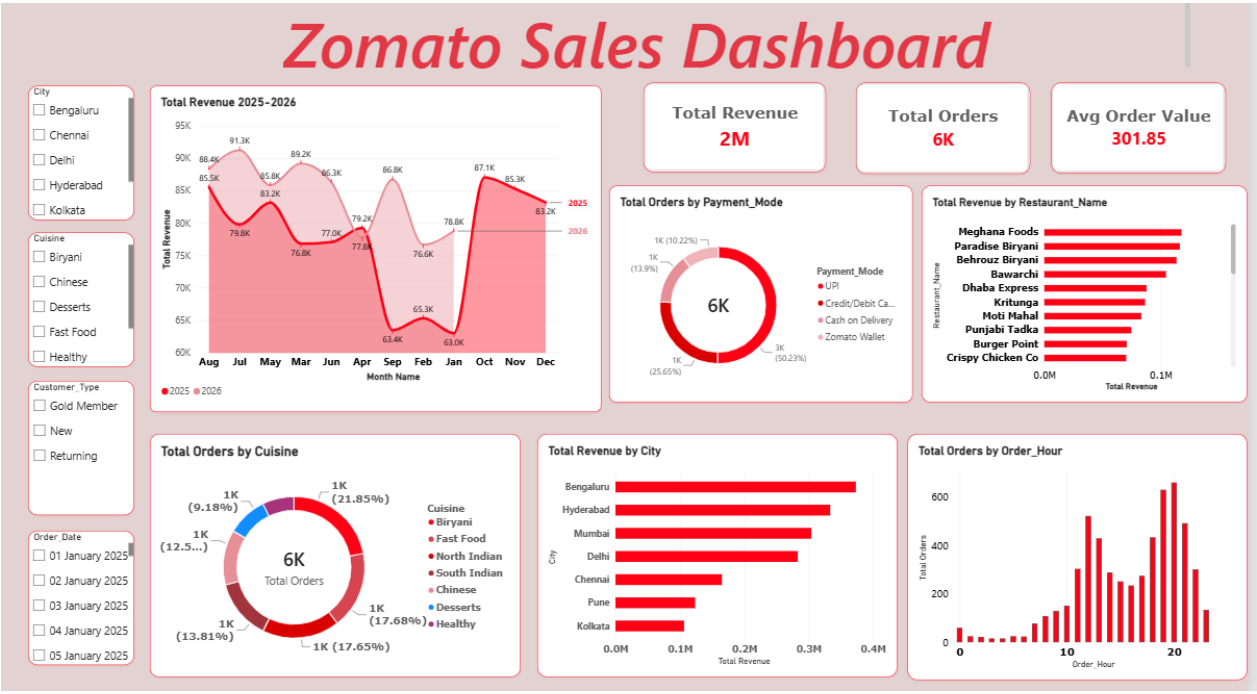

Figure 1: The finished Zomato Sales Dashboard in Power BI.

Zomato red (#E23744) is used as the main colour so that the dashboard matches the brand.

7. Key Findings

Measure	Result
Total orders	6,000
Total revenue (delivered orders)	about ₹16.9 lakh (₹1,689,735); the dashboard card shows it rounded as 2M
Average order value	about ₹302 (301.85)
Average delivery time	about 34 minutes
Average customer rating	about 4.1 out of 5
Total discounts given	about ₹1.78 lakh

City performance. Bengaluru earns the most revenue (about ₹3.73 lakh), followed by Hyderabad (₹3.34 lakh), Mumbai (₹3.04 lakh) and Delhi (₹2.83 lakh). Pune and Kolkata are the smallest markets.

Cuisine performance. Biryani is the clear leader, with 1,321 orders and about ₹4.52 lakh in revenue. North Indian and Fast Food come next. Desserts and Healthy food have the lowest revenue.

Top restaurants. The top three by revenue are Meghana Foods, Paradise Biryani and Behrouz Biryani, all biryani brands.

Peak time. Orders peak at 8 PM and 7 PM (dinner), with a second peak at 12 PM (lunch).

Peak days. Saturday (1,059 orders) and Sunday (992 orders) are the busiest, which is higher than any weekday.

Payments. UPI is the most used method (about 50%), followed by cards (26%), cash on delivery (14%) and Zomato Wallet (10%).

Customers. Half of the orders come from returning customers, and new customers and Gold members are each about 25%.

8. Business Recommendations

- Add more delivery partners at lunch (12 PM) and dinner (7–9 PM) to keep delivery times low.
- Run weekend offers, because Saturday and Sunday bring the most orders.
- Promote biryani restaurants, since they bring the largest share of revenue.
- Grow Pune and Kolkata with city-specific offers, as they are the smallest markets.
- Encourage UPI payments, as customers already prefer them.

9. Limitations

- The data is a sample of 6,000 orders, not the full Zomato dataset.
- 2026 covers only nine months, so a full-year comparison with 2025 is not fair.

- The dataset has no customer location (area level) or item-level detail.

10. Conclusion

This project shows how Power BI can convert raw order data into a simple, interactive dashboard. With a few clicks, a manager can see which cities, cuisines and times matter most, and which restaurants bring in the most revenue. The same approach can be applied to a real company dataset to support day-to-day business decisions.

11. Future Scope

- Use real, larger datasets and connect them to live data sources.
- Add forecasting to predict future orders.
- Add map visuals to show city and area performance.
- Publish the dashboard to the Power BI Service for sharing.
